

Indian Cuisine Insights

Overview

This dashboard explores India's dishes across regions, states, courses, diets, flavors, and preparation times. It highlights category distributions, regional concentrations, and time effort patterns, and surfaces extremes to guide curation or planning.

Overall Insights

- Vegetarian recipes overwhelmingly dominate the dataset (226 vegetarian vs 29 non-vegetarian; ~88.6% vegetarian), so conclusions about non-veg dishes are based on a small sample and may be unreliable.
- A few extreme prep-time outliers drive long-duration statistics: Pindi chana (500 min), Puttu (495 min), and Misti doi (480 min) are far above other dishes and likely reflect lengthy traditional processes or inconsistent time recording.
- Prep/cook time records show bucketed irregularities and gaps (many buckets with zero averages and sudden jumps at 120, 240, 360 minutes), indicating possible data-entry or bucket-mapping issues rather than smooth real-world distributions.
- At high-duration buckets the dataset often records prep without cook time (prep = 240/360 while cook = 0), suggesting some entries log only total or only one component, creating inconsistent time decomposition.
- Flavor strongly maps to course: spicy flavors concentrate in main courses (96 main-course spicy) and snacks (35 spicy), while sweet flavors concentrate in desserts (85 sweet), indicating predictable course-flavor associations.
- Some cross-over and unknowns exist (e.g., main course includes small counts of sweet and bitter and 26 “Unknown” flavors), so not all recipes follow the dominant flavor-course mapping.
- Regional course combinations show heavy tails: South snacks have unusually high average and median total times (average ~194.5 min, median 145 min), implying either complex snack preparations or outlying entries in that segment.
- East desserts exhibit the highest average total time among desserts (99.7 min, median 60), while North main courses have the largest recipe count (37) with a substantial average total time (76.9 min, median 60), so long average durations are concentrated in East desserts and South snacks, while volume is highest in North main courses.
- Because non-vegetarian counts are small and several time fields appear inconsistent or bucketed, prioritize data cleaning (normalize prep vs cook vs total), verify extreme outliers, and collect more non-veg samples before making product or operational decisions.

52.2%

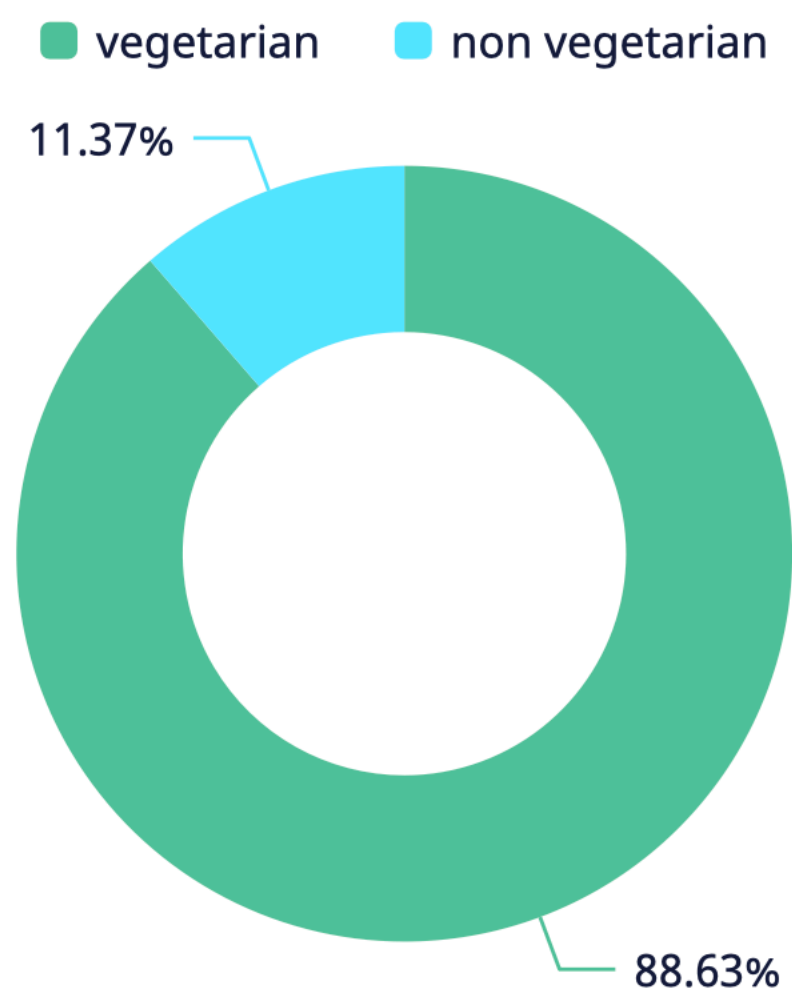

Vegetarian Share

88.6%

Diet Split

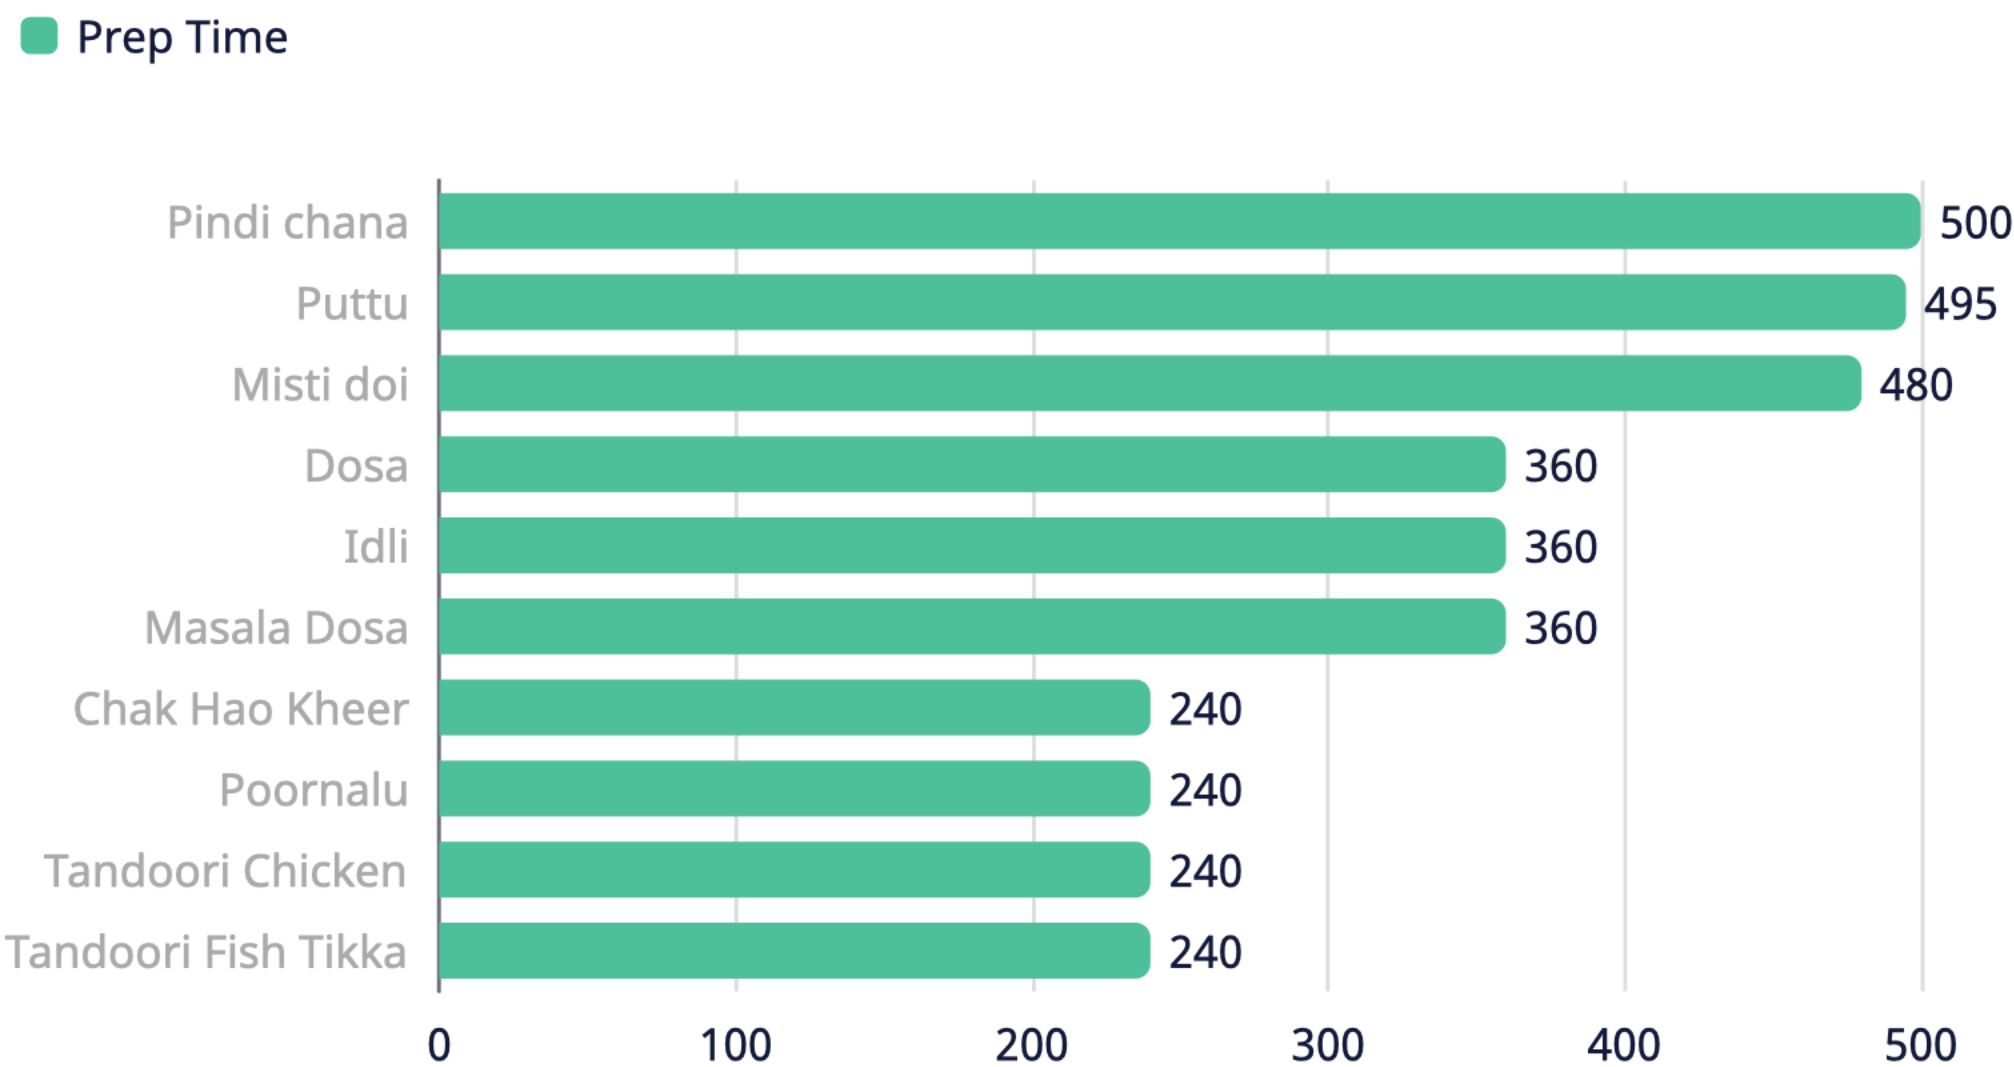

Key Insights

- Vegetarian dishes dominate the dataset: vegetarian = 226 vs non vegetarian = 29, meaning vegetarian recipes account for roughly 88.63% of the total shown on the chart.
- The non-vegetarian subset is small (29), so any analysis or product decisions for non-veg dishes will be based on a much narrower sample and may need additional data collection.

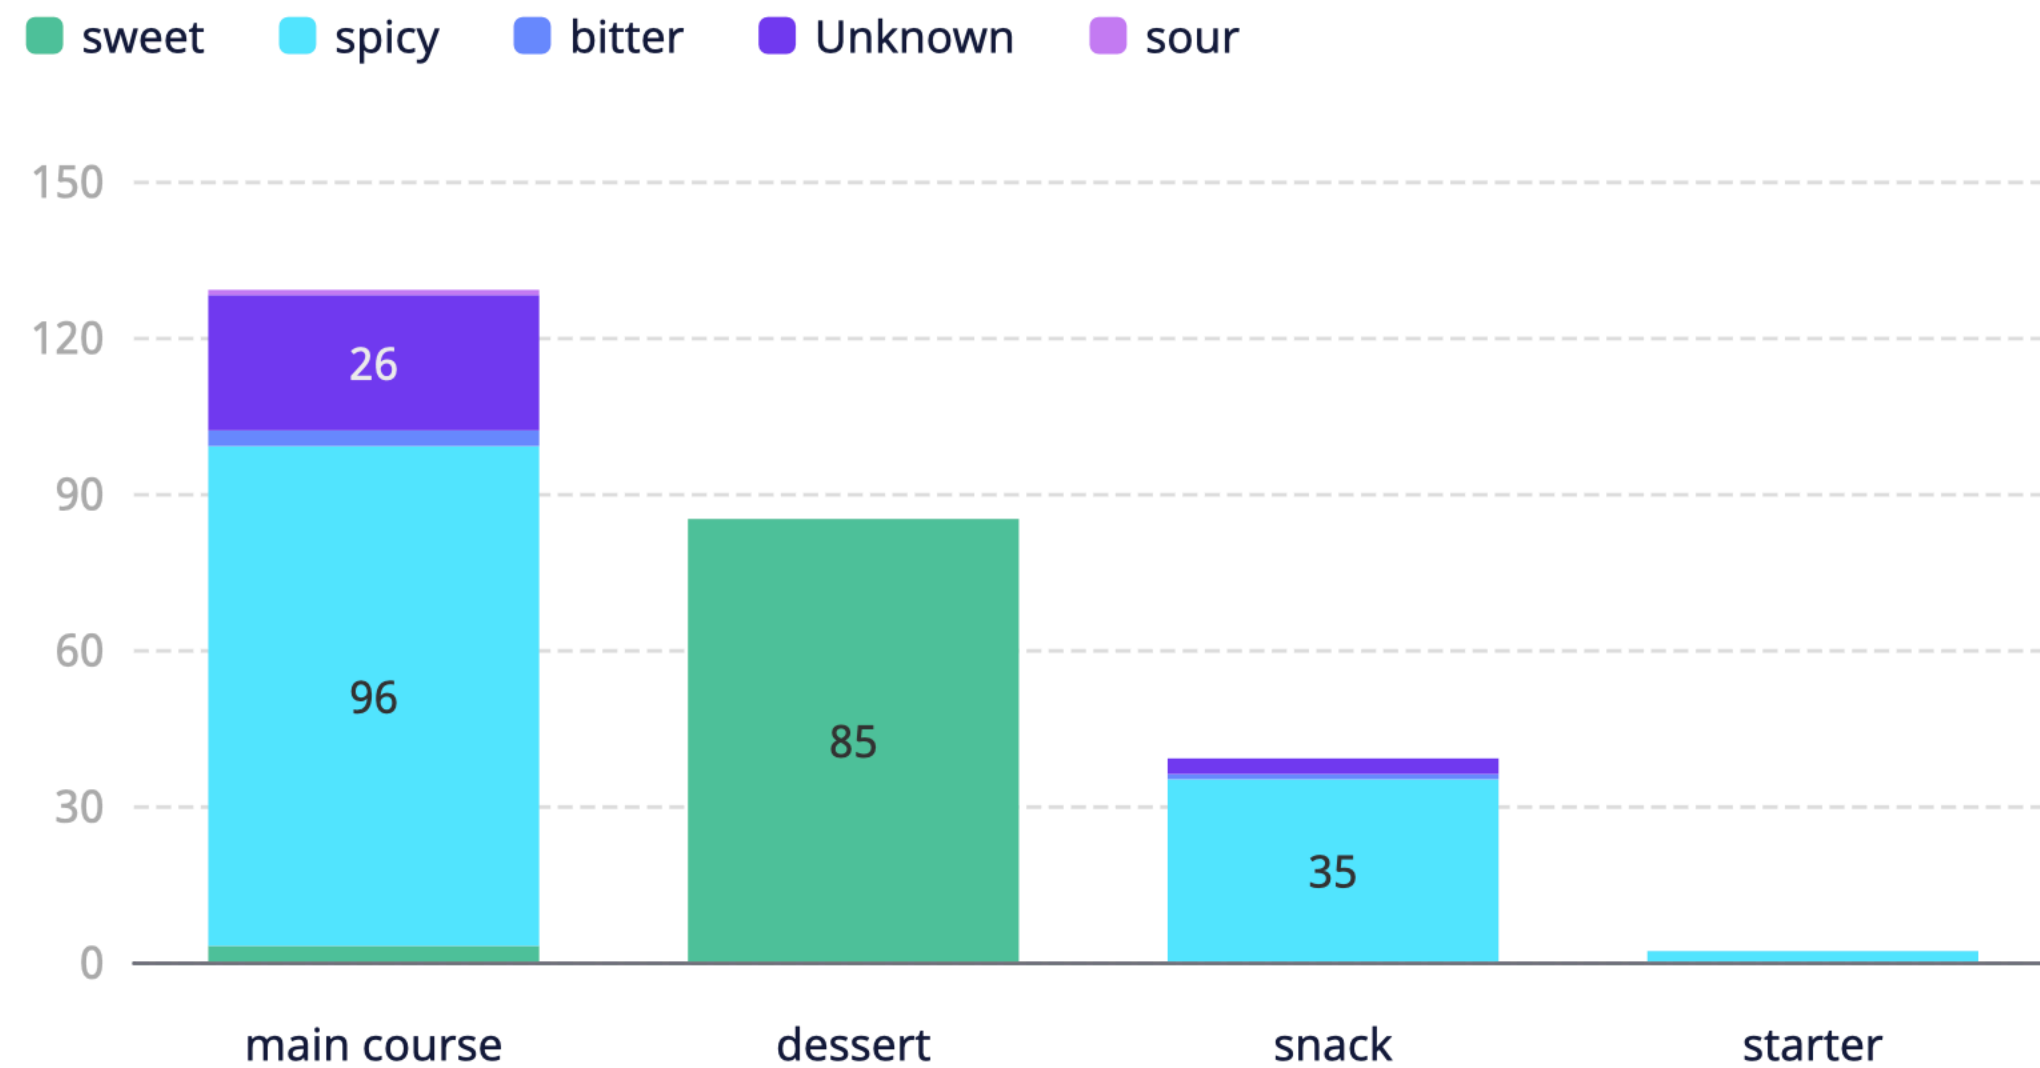

Key Insights

- There are extreme long-prep outliers: Pindi chana = 500 min, Puttu = 495 min, Misti doi = 480 min, far above the next group at 360 min (Dosa/Idli/Masala Dosa).
- Three dishes (Pindi chana, Puttu, Misti doi) each exceed 480 minutes prep time, indicating either lengthy traditional processes or possible data-entry of total elapsed time rather than hands-on prep.

Longest Prep Time Dishes

Flavor Profile by Course

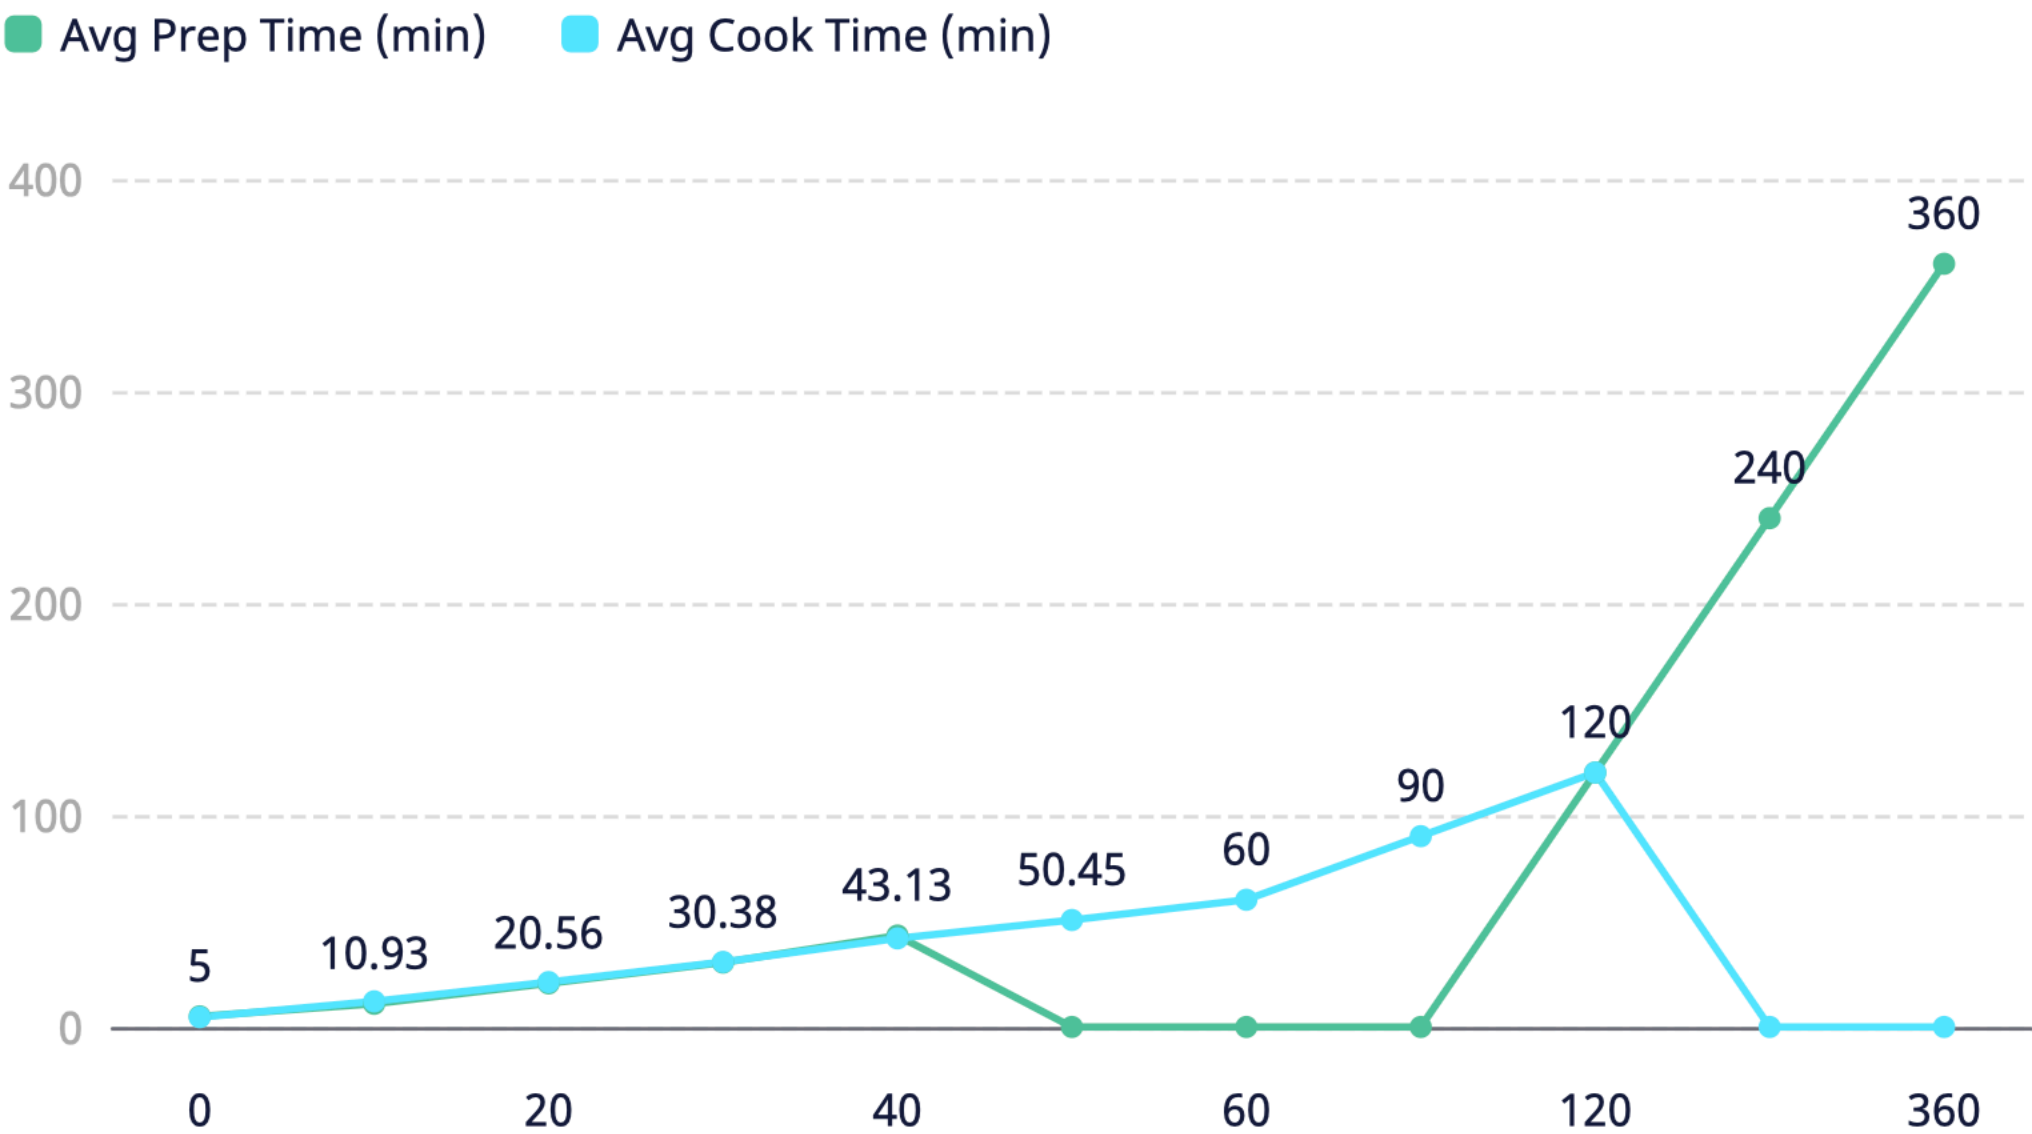

Key Insights

- Flavor is strongly course-specific: 'spicy' = 96 in main course while 'sweet' = 85 concentrates almost entirely in dessert, showing a clear mapping of spicy → main course and sweet → dessert.
- Main course also includes 26 'Unknown' and small counts of sweet (3) and bitter (3), suggesting some cross-over but the dominant patterns are: main course = spicy, dessert = sweet, snack = mostly spicy (35).

Key Insights

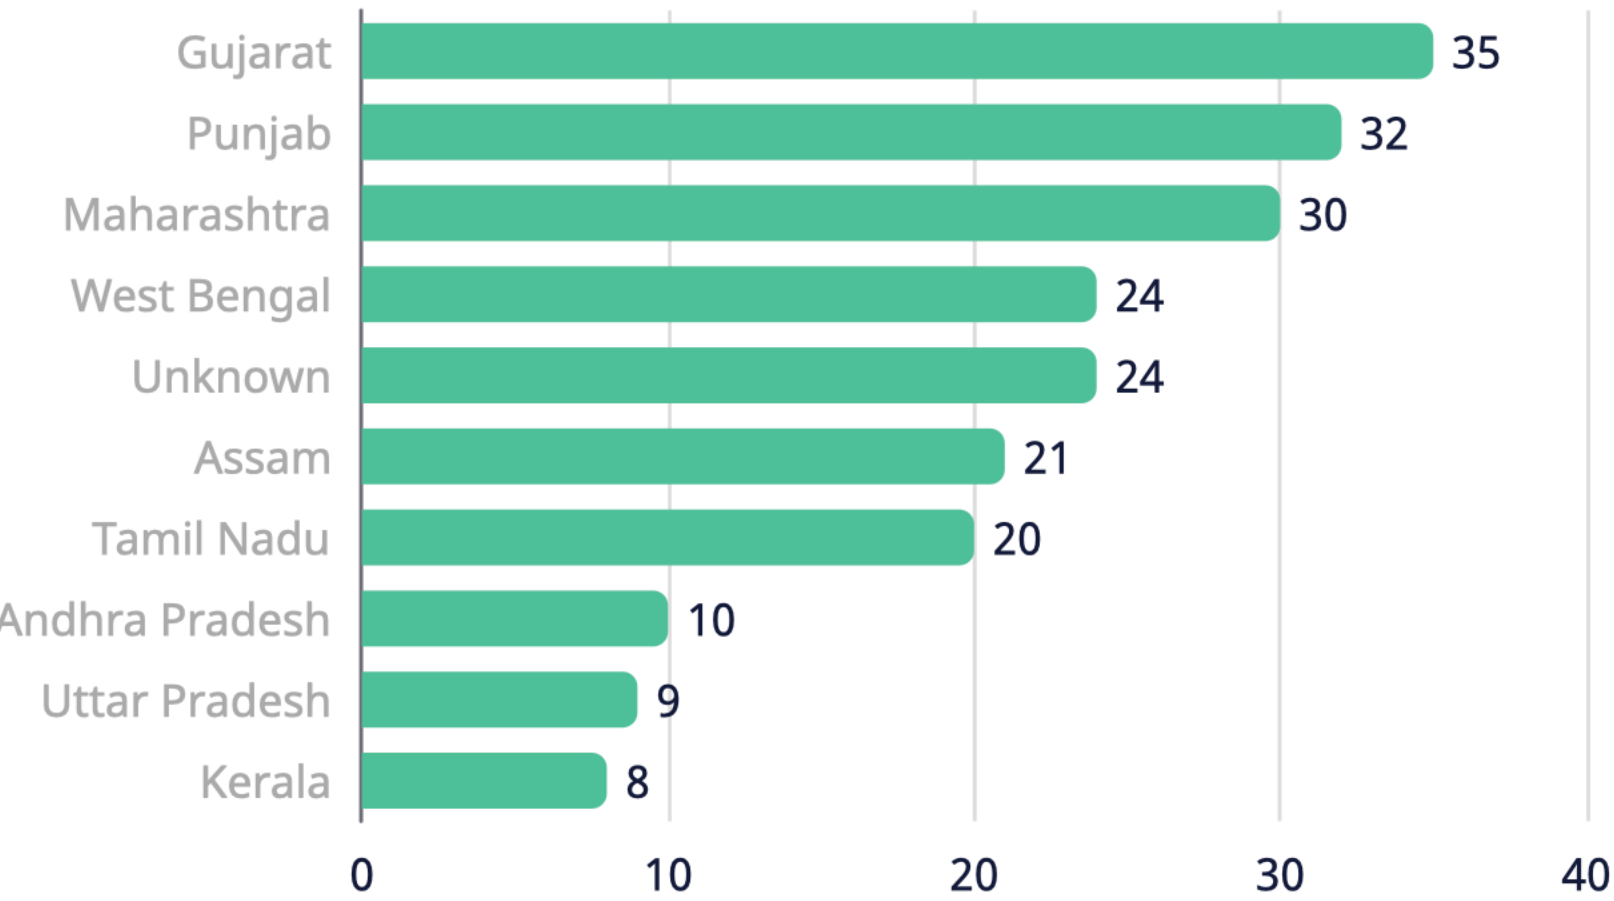

- Average prep and cook times show irregular distribution and data gaps: Avg Prep Time is 0 at buckets 50, 60, 90 but jumps to 120 at bucket 120 and up to 360 at bucket 360; Avg Cook Time is 0 at 240 and 360 but increases steadily to 120 at bucket 120.
- The prep and cook lines diverge at higher buckets: at 120 both Avg Prep and Avg Cook are 120, but at 240 prep = 240 while cook = 0, and at 360 prep = 360 while cook = 0 — this suggests some entries record only prep or only cook time at extreme durations or there are bucket-mapping issues.

Region and Course Time Stats

Region	Course	Count	Average Total Time	Median Total Time
North	main course	37	76.89	60
South	main course	27	82.59	45
West	main course	26	46.92	50
West	dessert	20	84.85	47.5
West	snack	20	47.3	47.5
East	dessert	19	99.74	60
South	dessert	18	58.61	40
South	snack	10	194.5	145
North	dessert	8	58.75	57.5
North East	main course	8	35.63	30
East	main course	8	48.13	47.5
Unknown	dessert	6	47.5	50

Key Insights

- Some region-course combinations show unusually high average/median total times, notably South snack: Average Total Time = 194.5 with Median Total Time = 145, indicating a heavy-tail or outliers in snack prep times for the South.
- East dessert has the highest Average Total Time = 99.74 (Median = 60), and North main course has the largest count (37) with Average Total Time = 76.89 and Median = 60, so the longest average durations are concentrated in East desserts and South snacks while the highest volume is North main courses.
